

Profound Introduces Next Generation Vibration Monitoring Equipment

Profound, a leading provider of professional foundation testing and geotechnical monitoring systems, has announced the international release of their next generation of Vibration Monitoring Equipment: the VIBRA. This system that is robust and yet lightweight, portable and battery-operated, can be used to easily monitor vibrations, which may cause damage to buildings and sensitive equipment.

Profound's President, Peter Middendorp, commented on this development that "Profound has made a substantial investment to upgrade its Vibration Monitoring Equipment to accommodate the needs of the users of our existing monitoring equipment. One of these needs was for a system that allowed real-time review of the vibration monitoring measurements, and with the VIBRA we can provide that."

Gerald Verbeek, President of VMS, commented, "The release of this new equipment is the next step in providing vibration monitoring services to our customers in North America. Shortly after we began selling the Profound equipment, VMS-Profound established a training capability in the use of vibration monitoring equipment. Now with the release of this new generation of equipment we have an even better tool kit to meet our customers' requirements in the area of vibration monitoring."
